

INFECTIOUS DISEASES 

Coronavirus COVID-19 – Latest Updates

Updated on 12 March at 13:40.

At the beginning of the year, an epidemic caused by the new coronavirus COVID-19 began in China. So far, approximately 125,000 cases have been diagnosed globally. Infections have been reported by 118 countries.

We will update this page with the latest information on the spread of the virus and with instructions for preventing infection.

Epidemic areas

- The World Health Organisation (WHO) declared the coronavirus epidemic a pandemic on 11 March 2020.
- Epidemic areas are defined as those where more extensive chains of infection are being seen. The epidemic situation in Europe and North America has been changing rapidly and as a result, the classification of countries and territories as epidemic areas will be abandoned. The risk of coronavirus infection has increased throughout Europe and around the world.
- THL is monitoring and assessing the situation together with the European Centre for Disease Prevention (ECDC) and the World Health Organisation (WHO).
- THL will provide information and

instructions as the situation develops and is currently updating the instructions and material on the basis of new information.

- Check the Ministry for Foreign Affairs website for the latest [travel advisories](#) (in Finnish). There you can find important information about travelling abroad and instructions on how to submit a travel report.

The situation in Finland

- So far, 109 laboratory-confirmed cases caused by the novel coronavirus (COVID-19) have been diagnosed in Finland.
- Most of the cases diagnosed in Finland have been mild. Some those infected have also required hospital care.
- The statistics is published every day and includes the laboratory-confirmed cases reported by the hospital districts. There may be some delay in the numbers reported daily. All of the cases reported on the previous day are not necessarily included in the daily statistics.
- The cases can be divided by hospital district as follows (in alphabetical order):
 - South Karelia Social and Health Care District (Eksote): 1
 - Hospital District of Southern Ostrobothnia (EPSHP): 2
 - Hospital District of Helsinki and Uusimaa (HUS): 50
 - Kanta-Häme Hospital District (KHSHP): 8
 - Central Finland Health Care District (KSSHP): 6
 - Lapland Hospital District (LSPH): 1
 - Pirkanmaa Hospital District (PSHP): 13
 - North Karelia Hospital District (PKSSK): 1

- Northern Ostrobothnia Hospital District (PPO): 18
 - North Savo Hospital District (PSSH): 2
 - Satakunta Hospital District: 2
 - Southwest Finland Hospital District (VSSH): 5
- Finland is preparing for a wider epidemic. The speed at which the epidemic develops will vary across the country.
 - In areas where there is evidence of the spread of the epidemic within communities, the focus should be on protecting risk groups.
 - Direct conclusions for the situation in Finland or its development cannot be drawn from the epidemic situations in other countries.
 - Rapid identification of cases continues to be important in order to slow down the progress of the epidemic in Finland. Effective prevention measures and the prevention of secondary infections can reduce the spread of the virus especially among the elderly and those with underlying conditions.
 - It is important for people with mild symptoms of the virus to see it through at home and to avoid social contact with others. Reducing social contact is also important for healthy people, as this slows down the spread of the epidemic.
 - Finnish hospitals are well prepared for examining and treating coronavirus infections in isolation.

The situation in Europe

- A total of more than 22,000 cases have been diagnosed in Europe.
- The majority of the cases in Europe have been recorded in Italy, over 12,000 in total.
- In the Nordic countries, Sweden, Norway and Denmark have reported a

significant number of cases within the last week. For example, Sweden has reported more than 460 cases in total.

- The Public Health Agency of Sweden (Folkhälsomyndigheten) notified on 10 March that there are signs of the coronavirus spreading in the communities in the Stockholm region and the province of Western Götaland (Gothenburg).
- The situation in Europe is changing rapidly. In particular, the situation in the Nordic countries is being monitored and assessed closely.
- A summary of cases diagnosed in Europe [on the ECDC website](#).
- [Numbers of cases in the European countries](#) (WHO)

Epidemic situation elsewhere in the world

- The epidemic is unfolding, for example, in South Korea and Iran, which have reported thousands of cases.
- The majority of the total number of reported infections are still within China. There has been a decline in the number of cases in China and the epidemic seems to be relenting.
- So far, more than 4,600 people have died from the virus, with the majority of these deaths – over 3,100 – occurring in China.
- [Number of cases in different countries](#) (WHO)

What do we know about the novel coronavirus?

- The virus mainly spreads from person to person through droplet transmission in close contact. The virus can survive on surfaces and can also be transmitted as a contact infection by handling materials or surfaces contaminated with the sputum of an infected person.

Nevertheless, this is not considered the main route of infection.

- In everyday life, you can reduce your risk of infection by maintaining good hand hygiene.
- The incubation time, which is the time from the exposure to the first symptoms, is estimated to be approximately 2-12 days, on average approximately 4-5 days. How efficiently the virus spreads and the period of infectiousness are not yet well known.
- The patients' symptoms include fever, coughing and shortness of breath.
- So far, approximately 80% of the reported cases have been mild and the patients have recovered. The disease has been more severe in approximately 14% of the patients, causing symptoms such as pneumonia and/or shortness of breath, and 6% of the patients have been in a critical condition.
- The mortality rates of the disease are difficult to estimate. All asymptomatic and milder cases may not have been detected and reported. A comparison of mortality rates between different countries may provide a misleading picture of what the actual mortality rate currently is or will be if the epidemic spreads.
- Similarly, it is also difficult to estimate the number of people who have recovered from the disease. Different countries interpret the recovery criteria differently, and Finland, for example, does not provide information to the public on the health status of patients for reasons of privacy.
- According to the World Health Organisation WHO, over 70% of the over 80,000 infected people in China have recovered.
- The largest number of severe cases and deaths have been recorded in people aged over 70, who already have an underlying disease such as

diabetes, high blood pressure or a cardiovascular disease. People aged over 80 face the highest risk.

- The number of cases diagnosed in children and young people has been low and their symptoms have been mild. Only approximately 2% of all reported cases have been diagnosed in people aged under 19. The disease has been severe in only a very small proportion of young people.
- The novel coronavirus is likely to have originated from an individual infection from an animal to a person, after which the virus has started to spread between people. However, which animal was the source of the infections is not yet known.
- Coronaviruses have been identified both in people and in animals. They usually cause a mild respiratory infection. Serious cases have previously been caused by the SARS and MERS coronaviruses. The new coronavirus is genetically similar to the SARS coronavirus.
- Coronavirus infections can be prevented with good hand hygiene. Instructions: [Hand washing and coughing](#)

International risk assessment

- The ECDC and WHO regularly update their assessment of the situation. THL is monitoring the international situation, developing guidelines for health care and laboratories, assessing the health risks related to the coronavirus and drawing up assessments of how the situation with the virus may develop.
- On 30 January 2020, the World Health Organization (WHO) declared the new coronavirus epidemic a Public Health Emergency of International Concern (PHEIC).
- The World Health Organization (WHO) is not recommending any specific measures to tourists nor any restrictions on travel or international

trade.
