Updated on 26 June at 16.10

The corona virus epidemic has calmed down. From now on, the THL will only update the situational review page on business days, but will continue to monitor the situation closely at the same time. Hospital districts report deaths associated with the disease and the number of patients in hospital and intensive care three times a week on Mondays, Wednesdays and Fridays. The corona map will continue to be updated on a daily basis.

The situation in Finland in brief

- Reported cases in total: **7,191** (+ 19*)
* Change from previous day. The change in the total number of cases reported to the register is 19 cases. Of these, 17 are recent cases reported during the previous two weeks. Also see below for information on [Reporting of data](#).
- Tested samples in total: approximately **237,500** (-500**)
** The total number of samples tested has decreased (-500). Clinical microbiology laboratories conducting tests have reviewed their test volumes retrospectively and the figures have been more accurate. During the previous 24 hours, approximately 2,000 tests have been carried out.
- A total of **328** (+1***) deaths associated with the disease have been reported.
- The number of patients in hospital care in Finland is 24 (+2***).
- The number of patients in intensive care in Finland is 1 (-1***)
***For the time being hospital districts will report deaths associated with the disease and the number of patients in hospital and intensive care three times a week on Mondays, Wednesdays and Fridays. Figures updated on Friday 26 June. The figures will be updated for the situation review the next time on Monday 29 June.
- In relation to Finland's total population (5,543,233), the prevalence of cases is 130 cases per 100,000 people.
- During the most recent seven-day monitoring period (17–23 June), 40 new cases were diagnosed. The incidence of new cases in relation to the population was 1 cases per 100,000 inhabitants. During the previous monitoring period (10-16 June), the corresponding figures were 64 new cases with an incidence of 1 cases per 100,000 inhabitants.
 - Reporting delays can affect the numbers stated for the most recent monitoring period. It is therefore not possible to draw any certain conclusions on the increase or decrease of cases on the basis of the most recent monitoring period.
- Virus testing currently has a capacity of over **13,000** tests per day.
- An estimated 6,600 people have recovered, which is around 90% of reported cases. The estimate is based on the follow-up of the observed cases over a period of three weeks (21 days). A person is considered to have recovered, when they do not have any follow-up data related to the progress of the illness after 3 weeks have passed from diagnosis. (Estimate updated on 24 June.)
