2. Measures for preventing outbreaks

In Japan, sporadic cases of small numbers of patients have been observed.

At this stage, the spread of infection can be prevented by tracing the route of transmission, especially for close contacts.

The important thing is to minimize the spread of infection in the country by preventing one cluster of patients from creating another cluster.

Please refer to the handout below;

Message to the people in Japan

1.Characteristics of new coronavirus infections ascertained at present (As of February 25)

<The routes of transmission>

The routes of transmission are generally through droplets and contacts. It is not thought to be caused by airborne infections.

In addition, under certain circumstances, such as when talking to many people at a short distance in confined spaces, there is the risk of spreading the infection even without coughing or sneezing.

<About infectivity>

Infectivity varies from case to case. There have been suspected cases which spread the infection to many people. Meanwhile, there are many cases where the virus did not transmit to those surrounding the infected person.

< Common symptoms and risk of developing severe>

Often, fevers or respiratory symptoms may persist for around one week, and many patients complain of strong fatigue. It has been reported that the period of hospitalization tends to be longer than that of seasonal influenza.

Those infected often present only mild symptoms, which will heal in many cases. The severity of the novel coronavirus disease is not as great as infectious diseases with extremely high mortality rates, but it does have the higher risk than seasonal influenza. The risks of developing severe symptoms are particularly high among the elderly and patients with underlying diseases.

2.Prevention Measures and Guide of Consultation

It is important to wash your hands frequently and to cover your mouth and nose with a tissue, or with the crook of your arm if a tissue is unavailable, when coughing or sneezing to protect yourself and others from the virus, just as you do for the common cold or the flu. We strongly recommend everyday preventive actions to help keep the virus from spreading.

If you have any of the following symptoms, please consult with the consultation center for people with potential exposure to COVID-19:

- You have had cold symptoms or a fever of 37.5°C or over for four days or more.

(including when you need to continue to take an antipyretic)

- You have a strong feeling of weariness (fatigue) or shortness of breath (difficulty breathing).

* Please also consult with the consultation center if you are a senior citizen or have an underlying disease, and you have had the symptoms mentioned above for about two days.

If the consultation center suspects that you have been infected with the virus, it will introduce you to a medical institution where medical services for people with potential exposure to COVID-19 are available. Please visit the medical institution, wearing a facemask, and refrain from using public transportation.
