\* The prioritised ethnicity classification system is used in this table and below. This means each person is allocated to a single ethnic group, based on the ethnic groups they identify with. Where people identify with more than one group, they are assigned in this order of priority: Māori, Pacific Peoples, Asian, and European/Other. So, if a person identifies as being Māori and New Zealand European, the person is counted as Māori. See [Ngā tapuae me ngā raraunga: Methods and data sources](#) for further information.

The data categorized by ethnicity come from National Health Index (NHI) data collection, linked to data held in the EpiSurv database.

## New Zealand's approach to COVID-19 testing

New Zealand has a goal of maintaining the elimination COVID-19 in our country. Planned, targeted testing is one of the tools that can help meet this goal.

COVID-19 is a new disease, so we had to build a completely new testing capability.

There are two types of test for COVID-19:

- a viral test that shows if you are currently infected with the virus (also called a PCR test)
- an antibody test that shows whether you were infected before (also known as a serology test).

In New Zealand, the only publicly-available test is the viral test. This test is most reliable for diagnosing COVID-19 if it is taken at the right time (during the first week of the illness).

The first viral test result for COVID-19 was available on 22 January 2020, just over a month before the first case was detected here.

We don't test without planning. A testing strategy is agreed in advance, based on each stage of the crisis and how we decide to manage it.
