

Older adults (65 years and older)

Heart Disease

Diabetes

High Blood Pressure

Cancer

Weakened Immune Systems

- People 65 years or older, and/or people with medical issues, like heart disease, diabetes, high blood pressure, cancer, or a weakened immune system, are at a higher risk for getting very sick from COVID-19.
- If you are a high-risk individual and you develop fever or symptoms, call your doctor.
- If you are not sick enough to be hospitalized, you can recover at home. Follow your doctor's instructions and refer to [CDC recommendations for how to take care of yourself at home](#).

**General Population:**

- If you are in generally good health and have mild symptoms, stay home and take care of yourself like you would for a cold or the flu.
- If symptoms worsen, call your doctor.

If you are sick or are caring for someone who is sick, you can use the **Coronavirus Self-Checker** on the [CDC's Symptoms & Testing](#) page to help you make decisions about seeking appropriate medical care.

If you need help finding a doctor or accessing medical care, call 2-1-1 and they can direct you to low- or no-cost providers in your area.

See the CDC website for more information on how to take care of yourself and others at home if sick:

[WHAT TO DO IF YOU ARE SICK \(CDC\)](#)

## COVID-19 Testing

Your doctor will help make the decision if you should get tested for COVID-19.

If you do not have health insurance, you can still get tested for COVID-19 if your doctor or healthcare provider recommends it.

For information about testing, you just need to call your doctor and/or access care the way you usually do. If you need help finding a doctor or accessing medical care, call 2-1-1 and they can direct you to low- or no-cost providers in your area.

People can get [tested for COVID-19 at drive-thru locations](#) in certain parts of Texas.

## Symptoms of COVID-19

Patients with COVID-19 have reportedly had mild to severe respiratory illness. Symptoms can include:

Fever

Cough

Shortness of Breath

## Prevention of COVID-19

There is currently no vaccine to prevent COVID-19. The best way to prevent infection is to take steps to avoid exposure to this virus, which are similar to the steps you take to avoid the flu.

Wash hands with soap and water.

Use hand sanitizer as backup.

Cover coughs and sneezes.

Avoid touching face.

Disinfect often touched surfaces.

Avoid close contact.

DSHS recommends these everyday actions to help prevent the spread of any respiratory virus, including COVID-19:

- Wash hands often for 20 seconds and encourage others to do the same.
- If no soap and water are available, use hand sanitizer with at least 60% alcohol.
- Cover coughs and sneezes with a tissue, then throw the tissue away.
- Avoid touching your eyes, nose, and mouth with unwashed hands.
- Disinfect surfaces, buttons, handles, knobs, and other places touched often.

- Avoid close contact with people who are sick.

DSHS also recommends that you start practicing social distancing. Social distancing involves staying away from other people to avoid catching or spreading illness. It's a fancy term for avoiding crowds and minimizing physical contact. This could mean avoiding concerts or weddings, skipping the handshake, and/or staying at least six feet away from others.

See the CDC website for more information on what you can do at home to prevent the spread of COVID-19:

[GET YOUR HOUSEHOLD READY FOR COVID-19 \(CDC\)](#)

## How COVID-19 Spreads

Current understanding about how the virus that causes COVID-19 spreads is largely based on what is known about similar coronaviruses.

The virus is thought to spread mainly from person to person:

- Between people who are in close contact with one another (within about 6 feet).
- Via respiratory droplets produced when an infected person coughs or sneezes.

These droplets can land in the mouths or noses of people who are nearby or possibly be inhaled into the lungs.

People are thought to be most contagious when they are most symptomatic (the sickest). Some spread might be possible before people show symptoms; there have been reports of this with this new coronavirus, but this is not thought to be the main way the virus spreads.
